

Dramoir — Project Spec

What this is: Dramoir ("The Drama Shelf") is an Asian drama discovery site — launching with 706 K-dramas tagged by genre, trope, and mood/vibe, so users can find their next watch by *feel* rather than just browsing titles, and track shows in their own lists. The site's full structure (nav, filters, content types) is built for its final scope from day one; content for other types is added over time by the project owner directly in the database, without further development work.

Files that come with this document:

1. This spec (`dramoir-spec.md`)
2. `Dramoir.xlsx` — the live content database
3. Final Canva export — all screens + logo

1. Core Architecture

- **Data source:** The Google Sheet is the single source of truth for all content

(dramas, movies, actors, tags). The site auto-syncs from it on a schedule (or via on-demand revalidation) so the owner edits the sheet directly — no code changes needed to add, edit, or remove a title.

- **Accounts & Lists:** Login required, so "My List" and profile data sync across devices. This needs its own small database, separate from the content sheet.
- **Images:** Poster/Banner columns contain Pinterest (`pin.it`) links. On first load of any image, the site downloads and stores a permanent copy rather than depending on the Pinterest link staying reachable.
- **Recommendations:** Fully automatic — see §6.
- **Hosting/budget:** Free-tier only, \$0/month target.
- **Domain name:** Launches on the free subdomain the host provides; a custom domain can be added later without any rebuild.
- **Platform:** Responsive website with PWA support (installable to phone home screen with its own icon). Not a native app.
- **Language:** English only.

Recommended tech stack

Piece	Choice	Notes
Frontend	Next.js (React) + Tailwind CSS	Incremental Static Regeneration lets pages auto-refresh from the sheet on a timer, no manual rebuild
Hosting	Vercel (free tier)	Native Next.js support, generous free bandwidth
Auth + user database	Supabase (free tier)	Login/accounts + "My List" storage (Postgres); free tier covers ~50k monthly active users
Content sync	Google Sheets API (read-only service account)	Pulls all content sheets on a schedule or via ISR revalidation
Image caching	Supabase Storage (free tier)	Downloads and stores a permanent copy of each Pinterest-linked image on first load

Piece	Choice	Notes
PWA support	next-pwa plugin	Installable home-screen icon, offline shell

2. Site Structure

Full navigation is live from launch, even where a content type has no data yet:

- **Dramas** — Dramas List, Top Dramas, Recommendations (*populated — K-dramas*)
- **Movies** — Movies List, Top Movies, Recommendations (*titles exist, not yet tagged — shows "coming soon" until tagged rows exist*)
- **Variety Shows** — Variety Shows List (*empty — "coming soon"*)
- **My List** (per logged-in user) — Favorites, Currently Watching, Completed, Want to Watch, Finish Later, Dropped, Custom Lists
- **Actors List** — searchable list of actors

Filters (Status, Country, Type, Year, Genres, Tropes, Mood & Vibe) include every country/type already present across the content sheets — Korea is populated now; China, Japan, and other countries/types populate as

the owner adds rows to their respective sheets, with no developer involvement required.

3. Screens

- Home / onboarding hero ("Meet Dramoir — The Drama Shelf" + "Get started — it's free" CTA for new visitors)
- Hamburger nav menu
- Search + Filters panel, with Tropes expanding into category-grouped results
- Drama/Movie detail page (poster, banner, rating, genres, tropes, mood/vibe tags, synopsis, cast, recommendations)
- Actor detail page: actor photo + name, tabs to split **Series** vs **Movies**, grid of their titles (poster + year) — clicking a cast member from a detail page opens this
- User profile page (large circular avatar, username, list previews)
- My List page/overlay (tabs for each list type)
- Actors List grid
- "Coming soon" placeholder for content types/countries with no tagged data yet

- Login / Sign up

Logo: Stylized "D" monogram (ribbon/page-fold motif)
— used as favicon/app icon
and small-format mark. Full wordmark ("Dramoir" +
"THE DRAMA SHELF") used on
headers/splash contexts.

Brand fonts:

- Wordmark ("Dramoir"): **Cormorant Garamond**
- Tagline / UI text ("THE DRAMA SHELF" and
general UI): **DM Sans**

Brand colors:

Hex	Use
#f5f5f5	Off-white background
#230612	Deep aubergine/near-black (headers, dark backgrounds, dark nav)
#e8d9e0	Blush pink (light backgrounds)
#7d5c65	Muted mauve (accents, secondary text/tags)

4. Data Structure & Source Mapping

The database is one workbook with a sheet per content type, plus shared reference sheets for tags. Every content sheet includes `type` and `country` columns, so filtering by type/country works identically across all of them.

Content sheets:

- `Kdrama Database` (706 rows) — columns: `Title`, `type`, `country`, `Year`, `Episodes`, `Status`, `Main role`, `Genres`, `Tropes`, `Mood / Vibe Tags`, `Global Rating (/10)`, `Poster URL`, `Banner URL`, `Synopsis`, `Curated Collections`
- `Movies Database` — columns: `Title`, `type`, `country`, `year`, `Genres`, `Tropes`, `Mood / Vibe Tags`, `Global Rating (/10)`, `Poster URL`, `Banner URL`, `Synopsis`
- `CDrama Database` / `JDrama Database` — same column shape as `Kdrama Database` (using `Cast` in place of `Main role`), currently empty, ready for content
- `reality shows Database` — columns: `Title`, `type`, `country`, `Year`, `Mood / Vibe Tags`, `Global Rating (/10)`, `Poster URL`, `Banner URL`, `Synopsis`, currently empty, ready for content

Treat these as one logical content table for site purposes (site queries across all content sheets by `type / country` , rather than hardcoding "K-drama" as the only content type).

Site element	Source
Title, year, episodes, status	matching column on the relevant content sheet
Type / Country filters	<code>type / country</code> columns, present on every content sheet
Cast list (names)	<code>Main role</code> (Kdrama) or <code>Cast</code> (CDrama/JDrama) – comma-separated names
Cast photos on detail page	look up each name against <code>Actors Reference! Actor Name</code> → use its <code>Photo URL</code>
Genre chips/filter	<code>Genres</code> column (comma-separated); canonical option list lives in  <code>Genres</code>
Trope chips/filter	<code>Tropes</code> column (comma-separated); canonical categorized list lives in  <code>Tropes</code> (Category column + Trope column – a blank

Site element	Source
	Category cell means "same category as the row above")
Mood/Vibe chips/filter	Mood / Vibe Tags column (comma-separated); canonical list + descriptions live in ✨ Mood & Vibe Tags
Global rating	Global Rating (/10)
Poster / Banner images	Poster URL / Banner URL (auto-cached per §1)
Synopsis	Synopsis
K-Drama Starter / curated homepage shelves	Curated Collections column on Kdrama Database — owner tags a row with a shelf name (e.g. K-Drama Starter); comma-separate if a title belongs to multiple shelves

Sheet: Actors Reference (1,244 rows) — columns:

Actor Name , Photo URL , Dramas

Site element	Source
Actors List grid	Actor Name + Photo URL (placeholder avatar if Photo URL is empty)
Actor detail page header	same row's Actor Name + Photo URL
Actor detail page grid	Dramas (comma-separated titles) → look each up across the content sheets for poster + year; split into Series/Movies tabs using that title's type

Sheet: 🎬 **Genres** — canonical genre list used to populate genre filter options across all content types.

Sheet: 🧩 **Tropes** — categorized master trope list, grouped as: How They Fall · Relationship Setups · Romance Foundations · Romance Styles & Tones · Iconic Physical Moments · Personality Pairings & Dynamics · Male Lead Archetypes · Female Lead Archetypes · Group & Community · Growth & Healing · Crime, Mystery & Investigation · Action & Thriller · Power, Wealth & Society · Conflict & Betrayal

· Settings & Worlds · Historical & Palace · Supernatural & Fantasy · Identity & Disguise · Connections & Fate · Format & Style. Used to group the trope filter UI by category.

Sheet: ✨ **Mood & Vibe Tags** — canonical mood/vibe list with descriptions, used for filter options and tag tooltips.

5. Recommendation Logic

Automatic, no manual curation:

- Score other titles by **shared tags** — weight **tropes and mood/vibe tags higher than genre** (genre is broad; tropes are the real taste signal).
- **Exclude** titles already in the user's own lists (Completed, Dropped, Currently Watching) from showing as a recommendation.
- **Secondary row:** "More with [actor]" — based on shared lead actor (via **Actors Reference**), alongside the trope/mood-based "More like this" row.
- Show *why* something was recommended (which tags matched).

- Cold-start fallback: if a title has very few tag overlaps with anything else, fall back to same genre + similar rating.
-

6. Phasing

Phase 1 (launch):

- Full site structure/nav live across all content types; K-dramas populated, other types show "coming soon" until tagged rows exist
- Accounts, user profiles, personal lists
- Automatic recommendations (trope/mood/genre + actor-based)
- Auto image caching from Pinterest links
- Actors with no photo: placeholder avatar
- Curated homepage shelves via **Curated Collections**
- Free-tier hosting, PWA install support, no custom domain yet

Phase 2 (later):

- Social layer: user feed, posting about watched/recommended titles, comments, following other users — built on top of the Phase 1 account system without a rebuild

- Movies, C-dramas, J-dramas, Variety Shows fully tagged and live (owner adds this directly to their respective sheets)
- Custom domain name
